

Hands-on Lab: Generative AI for Data Generation and Augmentation

Estimated time needed: **30** minutes

One of the principle advantages of generative AI is its ability to generate realistic synthetic data. The synthetic data is generated when a pretrained generative model responds to either a prompt, create new data samples, or transfers learns on a given data set. In addition, it creates samples that can augment the existing data set while maintaining the statistical distribution and interpretability of the data set.

In this lab, you will learn how to use generative AI to generate synthetic data samples and transfer learns on a given data set.

Learning Objective

In this lab, you will learn how to use a popular tool, [Mostly.ai](https://mostly.ai/), to create synthetic data samples to augment a CSV data set.

Data Set

You will use a data set that includes insurance records.

The data set is available at the following link:

[Insurance Dataset](#)

This data set is a cleaned-up version of the [Medical Insurance Price Prediction](#) data set, available under the [CC0 1.0 Universal License](#) on the [Kaggle](#) website.

Steps

1. Download the data set

The first step is to download the dataset on your machine. You will need to upload this file to the interface in a subsequent step. Click the link provided in the **Data Set** section to download the data set.

2. Open the website

Click the following link to open the mostly.ai website and interface.

<https://mostly.ai/>

This link opens in a new browser tab, and you should see an web page that looks similar to the following screen capture:

3. Create an account

You can create an account on this website free of charge, or you can simply log in using your Gmail ID. After you log in, you'll see the following interface.

4. Upload the data set

- Click on the **Generators** given on the left hand side of the page.

- And upload the CSV file of the data set to the interface by using the **Upload your data** option available on the console.

Generators

Generators are models that learn from original data. Once trained, they allow to create any number of synthetic samples as well as simulated scenarios to you.

Train a generator

On platform
Train a generator with your data on platform.
Start from a connector
Upload your data

Locally
Train a generator on your environment and import it to use it in the platform.
Use the SDK
Import a generator

Available generators

Search

Name	Visibility	Status	Activity	Created
drxtn93742/insurance_dataset (1)	Private	Ready	0 1	10 minutes ago

- After you upload the data set, you will see its filename on the console. Then select Proceed as seen in the following screen captures:

5. Data configuration settings

- You can choose to modify the category of an attribute, or you can choose to include a parameter in the augmentation process without these settings. For the purposes of this lab, do not change these settings.

6. Model configuration settings

You can modify the max training time, number of epochs, sample size, and other settings to generate the best possible model based on your requirements. For the purpose of this lab, use the default settings.

The screenshot shows the 'Model configuration' step in the MOSTLY AI interface. On the left sidebar, 'Generators' is selected. The main area displays the 'insurance_dataset' as the subject table, with 1,338 rows and a 10-minute training time. The 'Configure data' button is highlighted in the top right corner.

When you complete working with the settings, select **Start training**. You will find this option on the top right corner of the web page.

The screenshot shows the 'Model configuration' step in the MOSTLY AI interface. The 'insurance_dataset' is selected as the subject table, with 1,338 rows and a 10-minute training time. The settings are as follows:

- Model**: Select the tabular model size. **MOSTLY_AI/Medium**
- Compute**: Select the compute type to train this model. **CPU Intel Xeon Spot: 14 CPUs, 26GB**
- Training parameters**: Adjust the training parameters to prioritize speed over accuracy, or vice versa.
 - Max training time: **10** mins
 - Max sample size: **1,338** rows

7. Model training

After the model training completes, you will see an onscreen result similar to what you see on the following screen capture.

8. Create Synthetic data

You can select the number of samples you want to generate, as well as modify the statistical nature of the data created by choosing the appropriate parameters. For the purpose of this lab, keep all the settings at their default values, and select Start generation to create the required synthetic data.

You can now use this synthetic data set for data science operations; or, you can also augment the original data set with these samples.

Conclusion

Congratulations! You have completed the lab on data augmentation using the Mostly.ai tool.
